Performance Testing

Date	29 September 2026
Team ID	SWTID-2026-3672
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how the ServiceNow Flow Designer solution behaves when standard laptop requests are submitted and processed. The testing focuses on request submission, flow execution, approval handling, procurement task creation, notifications, and request status updates.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Developer Instance (PDI) and Flow Designer execution history
Type of Testing	Functional performance / workflow load observation
Target Module / API	Standard Laptop Request Catalog Item and Standard Laptop Procurement Automation Flow
Test Environment	ServiceNow Developer Instance (PDI)
Test Date	29 September 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Submit a Standard Laptop Request and verify RITM creation and flow trigger	1	60	Request is created and the flow starts without unexpected delay.
2	Process an approved laptop request through manager approval and procurement task creation	1	60	Approval completes and an SC Task is created for IT Procurement.
3	Process a rejected laptop request and verify notification/status handling	1	60	Request follows the rejection branch and requester is notified.
4	Submit multiple standard laptop requests sequentially and observe Flow Designer execution	5	120	Requests are processed correctly without failed or stuck flow executions.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	To be measured	Pending	Record from test execution
2	Response Time (Max)	< 5 seconds	To be measured	Pending	Record maximum observed time
3	Throughput (Req/sec)	Record measured value	To be measured	Pending	Measure completed requests per second
4	Error Rate	< 1%	To be measured	Pending	Check failed flow/request executions
5	CPU Utilization	< 80%	To be measured	Pending	Measure if environment metrics are available
6	Memory Utilization	< 80%	To be measured	Pending	Measure if environment metrics are available

Step 4: Observations & Analysis

Key Findings:	Performance observations should be recorded from ServiceNow Flow Designer execution history after running the above scenarios. No measured performance result is assumed in this document.
Bottlenecks Identified:	To be recorded if flow execution, approval processing, task creation, notification, or request updates show delays or failures.
Optimization Steps Taken:	Potential configuration improvements can be documented after testing, such as simplifying flow steps, avoiding unnecessary actions, or improving notification and approval handling.

Step 5: Screenshots / Evidence

Attach screenshots of the ServiceNow Flow Designer execution details, RITM/SC Task records, approval result, and notification evidence below.
