Sample Project Documentation

Date	29 September 2026
Team ID	SWTID-2026-3672
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	5 Marks

Project Description:

This ServiceNow project automates standard laptop procurement using Flow Designer. An employee submits a Standard Laptop Request through the Service Catalog. The workflow validates the request, routes it for approval, creates a procurement task when approved, sends notifications, and tracks the request through completion. The solution is designed for implementation and demonstration in a ServiceNow Developer Instance (PDI).

Project Scenarios

Scenario	Description
Scenario 1	An employee submits a Standard Laptop Request with employee, department, laptop model, RAM, and business justification. The RITM is created and the Flow Designer automation starts.
Scenario 2	The request is routed to the appropriate manager or IT approver. When approved, an SC Task is automatically created and assigned to the IT Procurement group.
Scenario 3	When the request is rejected, the workflow follows the rejection branch, updates the request status, and notifies the requester.
Scenario 4	After procurement completes the task, the request can be updated and closed, providing a clear end-to-end procurement lifecycle.

Technical Architecture:

The solution uses ServiceNow Service Catalog and Flow Designer as the main application layers. Users interact with the Standard Laptop Request Catalog Item. The RITM triggers the flow, which handles approval logic, creates an SC Task for IT Procurement, sends notifications, and updates request status. The design does not require a separate external database or API for the core workflow.

Pre-requisites:

• ServiceNow Developer Instance (PDI) access

• Basic ServiceNow administration and Service Catalog knowledge

• Flow Designer knowledge

• Understanding of Requested Items (RITMs) and Catalog Tasks (SC Tasks)

• Ability to create users, groups, catalog items, approvals, and notifications

Project Workflow:

Milestone 1: Catalog Item Setup — Create the Standard Laptop Request Catalog Item and required variables.

Milestone 2: Procurement Flow Development — Create the Flow Designer trigger and approval process.

Milestone 3: Procurement Task Automation — Create the SC Task and assign it to IT Procurement.

Milestone 4: Notifications and Status Tracking — Configure approval/rejection notifications and request status updates.

Milestone 5: Testing and Demonstration — Test approved and rejected paths and verify task creation and completion.

Milestone 6: Conclusion — Demonstrate the complete automated laptop procurement lifecycle.

Milestone 1: Catalog Item Setup

Create a Catalog Item named **Standard Laptop Request**. Add variables for Employee Name, Department, Laptop Model, Laptop RAM, and Business Justification. The laptop model choices can include Dell Latitude, HP ProBook, and Lenovo ThinkPad, while RAM choices can include 8 GB and 16 GB.

Milestone 2: Flow Designer Development

Create a flow named **Standard Laptop Procurement Automation**. Use the Requested Item (RITM) for the Standard Laptop Request as the trigger. Add approval logic and an If condition to separate approved and rejected requests.

Milestone 3: Procurement Task Automation

For an approved request, create a Catalog Task with a description such as 'Procure Standard Laptop' and assign it to the IT Procurement group. The task references the current RITM so procurement staff can work directly from the request.

Milestone 4: Notifications and Status Tracking

Send an approval notification when the request is approved and a rejection notification when it is rejected. Update the request status through procurement and completion stages.

Exploring the ServiceNow Solution:

Standard Laptop Request: The employee-facing Catalog Item collects the information required to process a standard hardware request.

Flow Designer: The automation coordinates the trigger, approval, decision logic, task creation, notifications, and request updates.

Procurement Task: The SC Task provides an actionable work item for the IT Procurement team.

Approval and Rejection Paths: The flow provides separate outcomes so that approved requests proceed to procurement while rejected requests are communicated back to the requester.

Conclusion:

The project demonstrates how ServiceNow Flow Designer can streamline standard laptop procurement by connecting Service Catalog requests, approvals, procurement tasks, notifications, and status tracking into one automated workflow. It provides a structured PDI demonstration and can be extended later with inventory integration, automated asset assignment, additional approval rules, or external procurement-system integration.
